Notes:

1. All of the values presented in this table may be somewhat different than previously published data as a result of correcting a previous procedure that rounded the Standardized means prior to calculating Normative Values. Current calculations were not rounded, but show in their respective tables as whole numbers for presentation purposes.
2. Values for the Core Scale and Right/Left Hip/Knee scales from the Hip and Knee instrument may be different than previously available data due to the recoding of responses "Could not do for Other Reasons" into missing values for items where that option was a possible response.
3. Values for the Adolescent scales are based on combined data from self-reported as well as parent-reported data. The values for the parent-reported data allow the scoring of certain questions to be recoded to missing if the parent rated the child as "too young for this activity," whereas this is not an option on the self-reported data.
4. Values for the Adolescent and Pediatric Pain/Comfort scale may not correspond to previously published data due to a correction in the process of counting missing values.
5. Values for the Adolescent and Pediatric Sports/Physical Functioning scale may be somewhat different than previously released values due to a coding modification which recodes three specific items: (a) participation in recreational outdoor activities, (b) participation in pickup games or sports, (c) participation in competitive level sports. Each item was recoded to missing if any a given item was rated as "no" but one of the explanatory reasons marked was because the activity is out of season or if a parent rater indicated the child was too young for the activity.
